AI Clinical Intelligence Platform

From raw medical data to regulatory-approved clinical decisions — augmenting physicians with real-time diagnostic intelligence at scale.

MEDTECH · DEEP LEARNING · CLINICAL AI

Made with GAMMA

The Problem Is Systemic

Specialist Shortage

Demand for diagnostic expertise far outpaces the supply of qualified radiologists and specialists globally.

Diagnostic Latency

Long turnaround times delay treatment decisions, increasing patient risk and system costs.

Human Error Under Load

In radiology alone, error rates reach **3–5%** — spiking significantly under high-volume stress conditions.

Fragmented Knowledge

Clinical intelligence is siloed across institutions, limiting the adoption of best-practice standards.

Made with GAMMA

Our Solution

A **regulatory-ready AI platform** embedded directly into clinical workflows — not a standalone tool, but a system of record for diagnostic intelligence.

Medical Image Analysis

Automated interpretation of CT, MRI, and X-ray studies using deep learning models trained on clinically validated datasets.

Clinical Decision Support

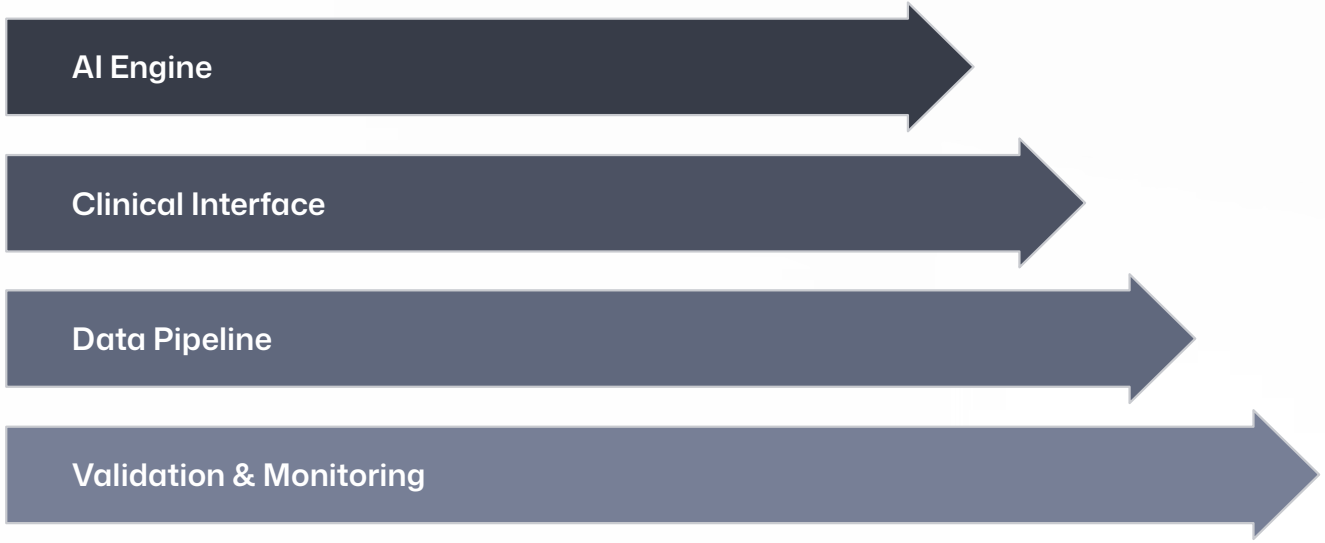
Real-time risk stratification, case prioritisation, and explainable AI findings surfaced directly within the physician's workflow.

Continuous Learning

Privacy-preserving feedback loops enable models to improve post-deployment as new clinical data is ingested.

Made with GAMMA

Product Architecture



Built as a Clinical System

Each module is designed for regulatory scrutiny — not just technical performance. The stack addresses the full lifecycle from raw DICOM data to auditable, explainable outputs that meet FDA and EMA standards.

CNN / Multimodal Models

PACS & EHR Integration

Anonymisation Layer

Made with GAMMA

Traction & Validation

94%

Diagnostic Accuracy

92–96% range across validated modalities

-40%

Time Per Case

Reduction in radiologist review time per study

>90%

Physician Agreement

AI findings confirmed by attending clinicians

1M+

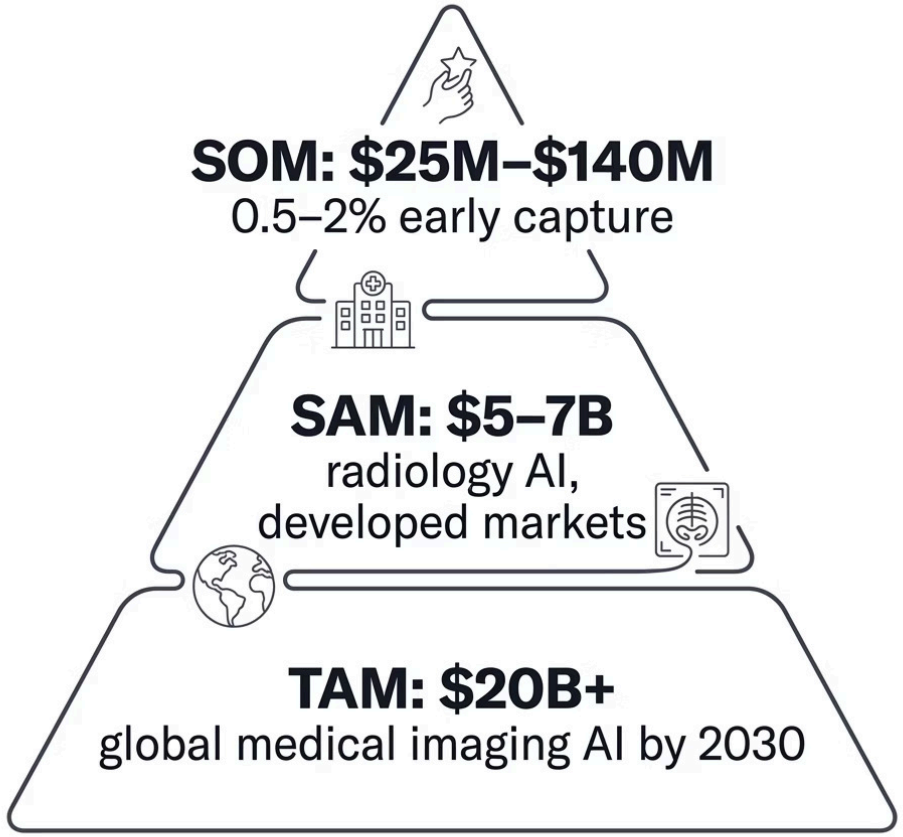
Studies in Pipeline

100K–1M+ studies across pilot datasets

Key benchmark: Δ (Doctor + AI) vs Doctor alone — the primary outcome metric driving our clinical validation design.

Made with GAMMA

Market Opportunity



A Generational Infrastructure Opportunity

The global medical imaging AI market is projected to exceed **$20B by 2030**. Our initial beachhead — radiology AI in developed markets — represents a serviceable market of **$5–7B**.

At early-stage capture rates of 0.5–2%, the realistic near-term revenue opportunity is **$25M–$140M** — achievable through focused enterprise contracting and pilot-to-production conversion.

Made with GAMMA

Competitive Moat

Data Quality Layer

Double annotation by clinical consensus — most competitors optimise models, we optimise the ground truth. Clinically validated datasets are a structural, hard-to-replicate asset.

Regulatory-First Design

FDA, EMA, and local authority compliance is architected in from day one — not retrofitted. This compresses approval timelines and creates a significant barrier to fast-follower competition.

Deep Workflow Integration

Embedded into PACS and EHR systems — not a bolt-on tool. Integration depth drives switching costs and increases clinical adoption velocity.

Made with GAMMA

Business Model

B2B SaaS for Healthcare Institutions

Per-Hospital Subscription

Annual enterprise contracts with predictable ARR.

Pay-Per-Study

$0.50–$5 per study, scaled by modality and volume.

API Licensing

Access for medtech platforms and enterprise EHR vendors.

Development Roadmap

1

Phase 1 – MVP

Single use-case (lung pathology). Pilot dataset. Initial hospital partnerships secured.

2

Phase 2 – Validation

Multi-centre clinical validation. Achieve >90% accuracy. Physician agreement benchmarked.

3

Phase 3 – Regulatory

FDA / EMA certification. Local authority approvals. Audit-ready model documentation.

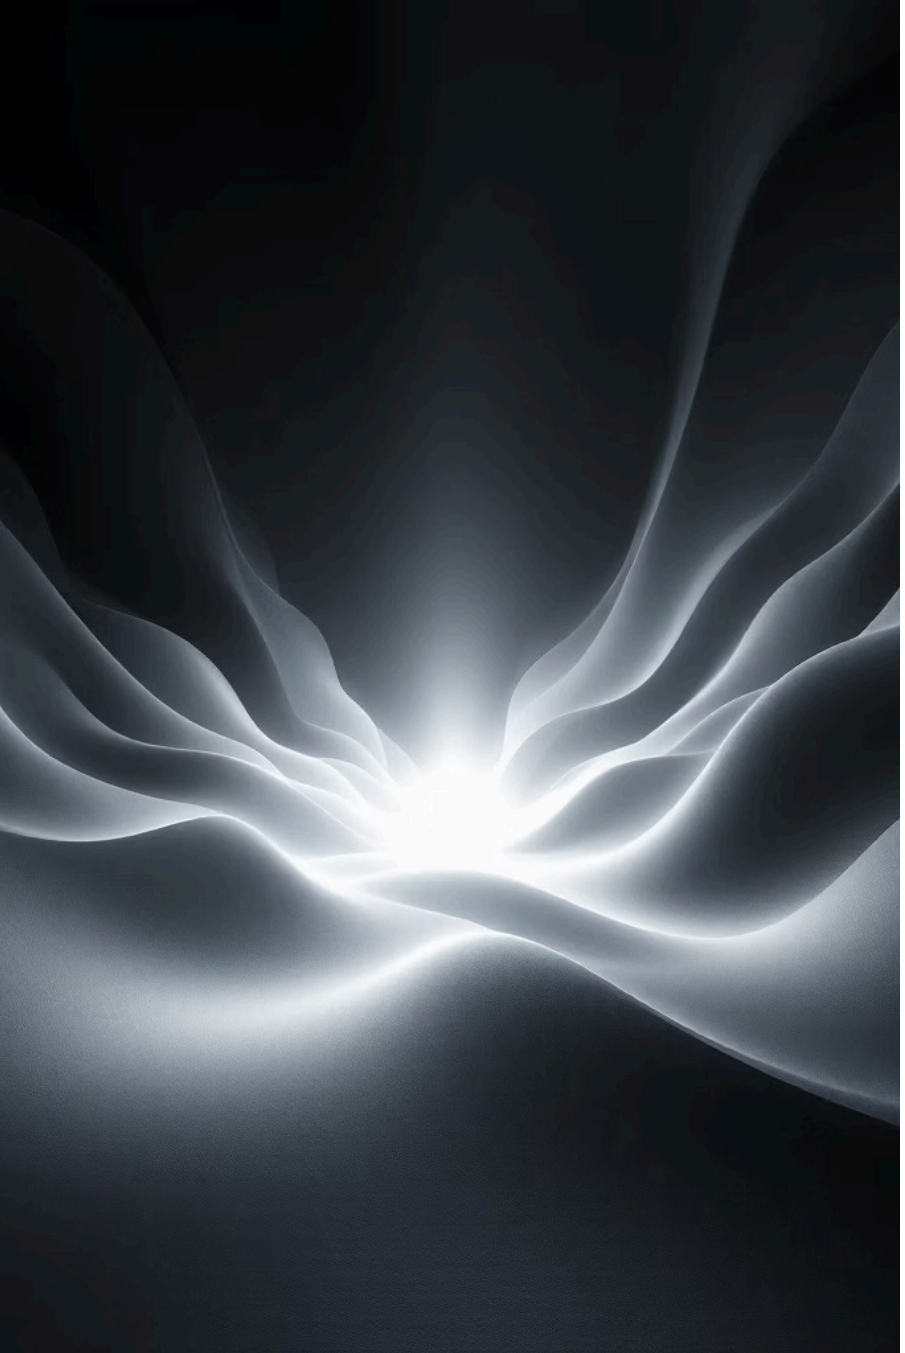
4

Phase 4 – Scale

Multi-disease expansion. International rollout. Multimodal AI (image + genomics + text).

This is not a typical ML pipeline — it is a **clinical system lifecycle**. Every phase is designed around regulatory evidence requirements, not engineering velocity alone.

Made with GAMMA



The Decisive Insight

> The winning company in medical AI will not be the one with the best model — but the one that solves **data, validation, regulation, and integration** as a single unified system.

Healthcare AI is not a software product. It is an **infrastructure layer for clinical decision-making**. We are building that infrastructure.

Pilot Hospitals

Seeking 3–10 anchor institutions for clinical validation

Clinical Partners

Radiologists and clinicians for annotation and feedback

Strategic Investors

Medtech and deeptech investors aligned with long-horizon infrastructure plays
